Software Engineering Topic 10 Software Risk Management & Reengineering

Acknowledgement

People Innovation Excellence These slides have been adapted from Pressman, R.S. (2015). Software Engineering : A Practioner's Approach. 8th ed. McGraw-Hill Companies.Inc, Americas, New York. ISBN : 978 1 259 253157. Chapter 35 and 36

Learning Objectives

LO 4 : Analyze the software project management and the proposed potential business project

Excellence

- Reactive versus Proactive Risk Strategies
- Software Risk
- Software Maintenance
- Business Process Reengineering
- Software Reengineering
- Reverse Engineering
- Forward Engineering

BINUS UNIVERSITY LEARNING **Reactive Risk Management**

Reactive versus Proactive Risk Strategies

- project team reacts to risks when they occur
- mitigation—plan for additional resources in anticipation of fire fighting
- fix on failure—resource are found and applied when the risk strikes
- crisis management—failure does not respond to applied resources and project is in jeopardy

BINUS UNIVERSITY ONLINE LEARNING Proactive Risk Management

Reactive versus Proactive Risk Strategies

- formal risk analysis is performed
- organization corrects the root causes of risk
 - TQM concepts and statistical SQA
 - examining risk sources that lie beyond the bounds of the software
 - developing the skill to manage change

Software Risk

- Maintain a global perspective—view software risks within the context of system and the business problem
- Take a forward-looking view—think about the risks that may arise in the future; establish contingency plans
- Encourage open communication—if someone states a potential risk, don't discount it.
- Integrate—a consideration of risk must be integrated into the software process
- Emphasize a continuous process—the team must be vigilant throughout the software process, modifying identified risks as more information is known and adding new ones as better insight is achieved.
- **Develop a shared product vision**—if all stakeholders share the same vision of the software, it likely that better risk identification and assessment will occur.
- Encourage teamwork—the talents, skills and knowledge of all stakeholder should be pooled

Software Risk

Risk Management Paradigm

BINUS UNIVERSITY ONLINE LEARNING Risk Identification

Excollonce

Software Risk

- *Product size* risks associated with the overall size of the software to be built or modified.
- *Business impact* risks associated with constraints imposed by management or the marketplace.
- Customer characteristics risks associated with the sophistication of the customer and the developer's ability to communicate with the customer in a timely manner.
- Process definition risks associated with the degree to which the software process has been defined and is followed by the development organization.
- Development environment risks associated with the availability and quality of the tools to be used to build the product.
- Technology to be built risks associated with the complexity of the system to be built and the "newness" of the technology that is packaged by the system.
- **Staff size and experience** risks associated with the overall technical and project experience of the software engineers who will do the work.

Software Risk

Assessing Project Risk-I

- Have top software and customer managers formally committed to support the project?
- Are end-users enthusiastically committed to the project and the system/product to be built?
- Are requirements fully understood by the software engineering team and their customers?
- Have customers been involved fully in the definition of requirements?
- Do end-users have realistic expectations?

Software Risk

• Is project scope stable?

Excellenc

- Does the software engineering team have the right mix of skills?
- Are project requirements stable?
- Does the project team have experience with the technology to be implemented?
- Is the number of people on the project team adequate to do the job?
- Do all customer/user constituencies agree on the importance of the project and on the requirements for the system/product to be built?

Risk Components

Software Risk

BINUS

UNIVERSITY

LEARNING

- *performance risk*—the degree of uncertainty that the product will meet its requirements and be fit for its intended use.
- *cost risk*—the degree of uncertainty that the project budget will be maintained.
- support risk—the degree of uncertainty that the resultant software will be easy to correct, adapt, and enhance.
- schedule risk—the degree of uncertainty that the project schedule will be maintained and that the product will be delivered on time.

BINUS UNIVERSITY ONLINE LEARNING Risk Projection

Software Risk

- Risk projection, also called risk estimation, attempts to rate each risk in two ways
 - the likelihood or probability that the risk is real
 - the consequences of the problems associated with the risk, should it occur.
- The are four risk projection steps:
 - establish a scale that reflects the perceived likelihood of a risk
 - delineate the consequences of the risk
 - estimate the impact of the risk on the project and the product,
 - note the overall accuracy of the risk projection so that there will be no misunderstandings.

Software Risk

Impact assessment

Components Category		Performance	Support	Cost	Schedule
	1	Pailure to meet the requirement would result in mission failure		Failure results in increased casts and schedule delays with expected values in excess of \$500K	
Cato strophic	2	Significant degradation to nonachi exement of technical performance	Norresponsive or unsopportable software	Significant financial shortages, budget overrun likely	Unachievoble IOC
Critical	1	Failurs to meet the requirement would degrade system performance to a point where mission success is questionable		Failure results in operational delays and/ar increased casts with expected value of \$100K to \$500K	
	N	Some reduction in technical performance	Minor delays in software modifications	Some shartage of Rinancial resources, possible overruns	Possible slippage in IOC
Marginal	1	Failure to meet the requirement would result in degradation of secondary mission		Costs, impacts, and/or recoverable schedule slips with expected value of \$1K to \$100K	
	14	Minimal to small reduction in Bedunical performance	Responsive softwore support	Sufficient financial resources	Reclistic, achievable schiedule
Negligible	+	follors to meet the requirement would create inconvenience or nonoperational impact		Error results in minor cost and/or schedule impact with expected value of less from \$1K	
	14	No reduction in technical performance	Easily supportable software	Possible budget underrun	borly achievable IOC

Note: [1] The potential consequence of undetected software errors or builts. [2] The potential consequence if the desired outcome is not achieved.

Building the Risk Table

Software Risk

- Estimate the probability of occurrence
- Estimate the impact on the project on a scale of 1 to 4, where
 - 1 = catastrophic
 - 2 = critical
 - 3 = marginal
 - 4 = negligible
- sort the table by probability and impact

Software Risk

Sample risk table prior to sorting

Size estimate may be significantly low PS 6 Larger number of users than planned PS 3 Less reuse than planned PS 7 End users resist system BU 4	0% 2 0% 3
Delivery decidine will be lightened BU 5 Funding will be lost CU 4 Customer will change requirements PS 8 Technology will not meet expectations TE 3 Lock of training on tools DE 8 Staff inexperienced ST 3 Staff tumover will be high ST 6	0% 2 0% 2 0% 1 0% 2 0% 1 0% 3 0% 2 0% 2 0% 2

Risk Exposure (Impact)

Software Risk

People Innovation Excellence

where

P is the probability of occurrence for a risk, and*C* is the cost to the project should the risk occur.

Excellence

Risk Exposure Example

Software Risk

- Risk identification. Only 70 percent of the software components scheduled for reuse will, in fact, be integrated into the application. The remaining functionality will have to be custom developed.
- Risk probability. 80% (likely).
- Risk impact. 60 reusable software components were planned. If only 70 percent can be used, 18 components would have to be developed from scratch (in addition to other custom software that has been scheduled for development). Since the average component is 100 LOC and local data indicate that the software engineering cost for each LOC is \$14.00, the overall cost (impact) to develop the components would be 18 x 100 x 14 = \$25,200.
- **Risk exposure.** RE = 0.80 x 25,200 ~ \$20,200.

Software Risk

Risk Mitigation, Monitoring, and Management

- Mitigation how can we avoid the risk?
- Monitoring what factors can we track that will enable us to determine if the risk is becoming more or less likely?
- Management what contingency plans do we have if the risk becomes a reality?

Excellence

Software Maintenance

- Software is released to end-users, and
 - within days, bug reports filter back to the software engineering organization.
 - within weeks, one class of users indicates that the software must be changed so that it can accommodate the special needs of their environment.
 - within months, another corporate group who wanted nothing to do with the software when it was released, now recognizes that it may provide them with unexpected benefit. They'll need a few enhancements to make it work in their world.
- All of this work is *software maintenance*

Software Maintenance

BINUS UNIVERSITY ONLINE LEARNING

Maintainable Software

- Maintainable software exhibits effective modularity
- It makes use of design patterns that allow ease of understanding.
- It has been constructed using well-defined coding standards and conventions, leading to source code that is self-documenting and understandable.
- It has undergone a variety of quality assurance techniques that have uncovered potential maintenance problems before the software is released.
- It has been created by software engineers who recognize that they may not be around when changes must be made.
 - Therefore, the design and implementation of the software must "assist" the person who is making the change

Software Maintenance

BINUS UNIVERSITY ONLINE LEARNING

Excollonce

Software Supportability

- "the capability of supporting a software system over its whole product life.
 - This implies satisfying any necessary needs or requirements, but also the provision of equipment, support infrastructure, additional software, facilities, manpower, or any other resource required to maintain the software operational and capable of satisfying its function." [SSO08]
- The software should contain facilities to assist support personnel when a defect is encountered in the operational environment (and make no mistake, defects *will* be encountered).
- Support personnel should have access to a database that contains records of all defects that have already been encountered—their characteristics, cause, and cure.

People Innovation Excellence

Business Process Reengineering

Reengineering

Excellence

Business Process Reengineering

- **Business definition.** Business goals are identified within the context of four key drivers: cost reduction, time reduction, quality improvement, and personnel development and empowerment.
- **Process identification.** Processes that are critical to achieving the goals defined in the business definition are identified.
- Process evaluation. The existing process is thoroughly analyzed and measured.
- **Process specification and design.** Based on information obtained during the first three BPR activities, use-cases are prepared for each process that is to be redesigned.
- **Prototyping.** A redesigned business process must be prototyped before it is fully integrated into the business.
- **Refinement and instantiation.** Based on feedback from the prototype, the business process is refined and then instantiated within a business system.

Excellence

BPR Principles

Business Process Reengineering

- Organize around outcomes, not tasks.
- Have those who use the output of the process perform the process.
- Incorporate information processing work into the real work that produces the raw information.
- Treat geographically dispersed resources as though they were centralized.
- Link parallel activities instead of integrated their results. When different
- Put the decision point where the work is performed, and build control into the process.
- Capture data once, at its source.

People

Software Reengineering

- ONLINE Inventory Analysis
- build a table that contains all applications
- establish a list of criteria, e.g.,

BINU

- name of the application
- year it was originally created
- number of substantive changes made to it
- total effort applied to make these changes
- date of last substantive change
- effort applied to make the last change
- system(s) in which it resides
- applications to which it interfaces, ...
- analyze and prioritize to select candidates for reengineering

Software Reengineering

Document Restructuring

- Weak documentation is the trademark of many legacy systems.
- But what do we do about it? What are our options?
- Options ...
 - *Creating documentation is far too time consuming.* If the system works, we'll live with what we have. In some cases, this is the correct approach.
 - Documentation must be updated, but we have limited resources. We'll use a "document when touched" approach. It may not be necessary to fully redocument an application.
 - *The system is business critical and must be fully redocumented.* Even in this case, an intelligent approach is to pare documentation to an essential minimum.

People Innovation Excellence BINUS UNIVERSITY ONLINE

LEARNING

Reverse Engineering

• Source code is analyzed using a restructuring tool.

Code Restructuring

- Poorly design code segments are redesigned
- Violations of structured programming constructs are noted and code is then restructured (this can be done automatically)
- The resultant restructured code is reviewed and tested to ensure that no anomalies have been introduced

People Innovation Excellence

• Internal code documentation is updated.

Reverse Engineering

- Unlike code restructuring, which occurs at a relatively low level of abstraction, data structuring is a full-scale reengineering activity
- In most cases, data restructuring begins with a reverse engineering activity.

Data Restructuring

- Current data architecture is dissected and necessary data models are defined.
- Data objects and attributes are identified, and existing data structures are reviewed for quality.
- When data structure is weak (e.g., flat files are currently implemented, when a relational approach would greatly simplify processing), the data are reengineered.
- Because data architecture has a strong influence on program architecture and the algorithms that populate it, changes to the data will invariably result in either architectural or code-level changes.

Forward Engineering

- 1. The cost to maintain one line of source code may be 20 to 40 times the cost of initial development of that line.
- 2. Redesign of the software architecture (program and/or data structure), using modern design concepts, can greatly facilitate future maintenance.
- 3. Because a prototype of the software already exists, development productivity should be much higher than average.
- 4. The user now has experience with the software. Therefore, new requirements and the direction of change can be ascertained with greater ease.
- 5. CASE tools for reengineering will automate some parts of the job.
- 6. A complete software configuration (documents, programs and data) will exist upon completion of preventive maintenance.

Forward Engineering

Economics of Reengineering-I

- A cost/benefit analysis model for reengineering has been proposed by Sneed [Sne95]. Nine parameters are defined:
 - P₁ = current annual maintenance cost for an application.
 - P₂ = current annual operation cost for an application.
 - P₃ = current annual business value of an application.
 - P₄ = predicted annual maintenance cost after reengineering.
 - P_5 = predicted annual operations cost after reengineering.
 - P₆ = predicted annual business value after reengineering.
 - P₇ = estimated reengineering costs.
 - P_8 = estimated reengineering calendar time.
 - P_9 = reengineering risk factor (P_9 = 1.0 is nominal).
 - L = expected life of the system.

Forward Engineering

Economics of Reengineering-II

• The cost associated with continuing maintenance of a candidate application (i.e., reengineering is not performed) can be defined as

 $C_{maint} = [P_3 - (P_1 + P_2)] \times L$

• The costs associated with reengineering are defined using the following relationship:

 $C_{reeng} = [P_6 - (P_4 + P_5) \times (L - P_8) - (P_7 \times P_9)]$

 Using the costs presented in equations above, the overall benefit of reengineering can be computed as

cost benefit = $C_{reeng} - C_{maint}$

Risk and Issues

• Some people have a confusion between risk and issues.

- Issue happen in the current condition
 - Example: the application have some bugs during the report calculation
- Risks will happen in the future
 - Example: Since there is no backup server, there is a possibility to have the system unavailability if the current production server is down

Case Study (1)

Risk and Issues

Case Study (2)

People Innovation Excellence

→ Issue Management (Problem solving, Corrective action)

→ Risk Management (Preventive action)

Risk and Issues

Case Study (3)

- Some people have a confusion between risk and issues.
 - Issue happen in the current condition
 - Example: the application have some bugs during the report calculation

- Risks will happen in the future

• Example: Since there is no backup server, there is a possibility to have the system unavailability if the current production server is down
